1.0. Introduction

The ACM38U-Y (CCID) Module Reader acts as an interface for the communication between a computer and a smart card. Different types of smart cards have different commands and communication protocols, which, in most cases, prevent direct communication between a smart card and a computer. The ACM38U-Y module reader, which shares the same core as the ACR38x (CCID) Smart Card Reader, establishes a uniform interface from the computer to the smart card for a wide variety of cards. By taking care of the card's particulars, it releases the computer software programmer from being responsible with smart card operations' technical details, which in many cases are not relevant to the implementation of a smart card system.

1.1. Reference Documents

The following related documents are available from www.usb.org

- Universal Serial Bus Specification 2.0 (also referred to as the USB specification), April 27, 2000
- Universal Serial Bus Common Class Specification 1.0, December 16, 1997
- Universal Serial Bus Device Class: Smart Card CCID Specification for Integrated Circuit(s)
 Cards Interface Devices, Revision 1.1, April 22, 2005

The following related documents can be ordered through www.ansi.org

- ISO/IEC 7816-1; Identification Cards Integrated circuit(s) cards with contacts Part 1: Physical Characteristics
- ISO/IEC 7816-2; Identification Cards Integrated circuit(s) cards with contacts Part 2: Dimensions and Locations of the contacts
- ISO/IEC 7816-3; Identification Cards Integrated circuit(s) cards with contacts Part 3: Electronic signals and transmission protocols

1.2. Symbols and Abbreviations

Abbreviation	Description	
ATR	Answer-To-Reset	
CCID	Chip/Smart Card Interface Device	
ICC	Integrated Circuit Cards	
IFSC	Information Field Sized for ICC for protocol T=1	
IFSD	Information Field Sized for CCID for protocol T=1	
NAD	Node Address	
PPS	Protocol and Parameters Selection	
RFU	Reserved for future use ¹	
TPDU	Transport Protocol Data Unit	
USB	Universal Serial Bus	

Table 1: Symbols and Abbreviations

-

¹ Must be set to zero unless stated differently.

2.0. Features

- USB 2.0 Full Speed Interface
- Plug and Play CCID support brings utmost mobility
- Smart Card Reader:
 - o Supports ISO 7816 Class A, B and C (5 V, 3 V, 1.8 V) cards
 - Supports microprocessor cards with T=0 or T=1 protocol
 - o Supports memory cards
 - o Supports PPS (Protocol and Parameters Selection)
 - Features Short Circuit Protection
- Application Programming Interface:
 - Supports PC/SC
 - Supports CT-API (through wrapper on top of PC/SC)
- Supports Android[™] 3.1 and above²
- Compliant with the following standards:
 - EN60950/IEC 60950
 - o ISO 7816
 - o CE
 - o FCC
 - o VCCI
 - o PC/SC
 - o CCID
 - o EMV™ 2000 Level 1
 - Microsoft® WHQL
 - o RoHS 2
 - o REACH

² PC/SC and CCID support are not applicable

3.0. Smart Card Support

3.1. MCU Cards

The ACM38U-Y (CCID) is a PC/SC compliant smart card reader that supports ISO 7816 Class A, B and C (5 V, 3 V, and 1.8 V) smart cards. It also works with MCU cards following either the T=0 and T=1 protocol.

The card ATR indicates the specific operation mode (TA2 present; bit b5 of TA2 must be 0) and when that particular mode is not supported by the ACM38U-Y (CCID), the reader will reset the card to a negotiable mode. If the card cannot be set to negotiable mode, the reader will then reject the card.

When the card ATR indicates the negotiable mode (TA2 not present) and communication parameters other than the default parameters, the ACM38U-Y (CCID) will execute the PPS and try to use the communication parameters that the card suggested in its ATR. If the card does not accept the PPS, the reader will use the default parameters (F=372, D=1).

Note: For the meaning of the aforementioned parameters, please refer to ISO 7816-3.

3.2. Memory-based Smart Cards

The ACM38U-Y (CCID) works with several memory-based smart cards, such as:

- Cards following the I2C bus protocol (free memory cards) with maximum 128 bytes page with capability, including:
 - o Atmel®: AT24C01/02/04/08/16/32/64/128/256/512/1024
 - o SGS-Thomson: ST14C02C, ST14C04C
 - o Gemplus: GFM1K, GFM2K, GFM4K, GFM8K
- Cards with secure memory IC with password and authentication, including:
 - o Atmel®: AT88SC153 and AT88SC1608
- Cards with intelligent 1 KB EEPROM with write-protect function, including:
 - o Infineon®: SLE4418, SLE4428, SLE5518 and SLE5528
- Cards with intelligent 256-byte EEPROM with write-protect function, including:
 - o Infineon®: SLE4432, SLE4442, SLE5532 and SLE5542
- Cards with '104' type EEPROM non-reloadable token counter cards, including:
 - o Infineon®: SLE4406, SLE4436, SLE5536 and SLE6636
- Cards with Intelligent 416-bit EEPROM with internal PIN check, including:
 - o Infineon®: SLE4404
- Cards with Security Logic with Application Zone(s), including:
 - o Atmel®: AT88SC101, AT88SC102 and AT88SC1003

4.0. Smart Card Interface

The interface between the ACM38U-Y (CCID) and the inserted smart card follows the specification of ISO 7816-3 with certain restrictions or enhancements to increase the practical functionality of ACM38U-Y (CCID).

4.1. Smart Card Power Supply VCC (C1)

The current consumption of the inserted card must not be higher than 50 mA.

4.2. Programming Voltage VPP (C6)

According to ISO 7816-3, the smart card contact C6 (VPP) supplies the programming voltage to the smart card. Since all common smart cards in the market are EEPROM-based and do not require the provision of an external programming voltage, the contact C6 (VPP) has been implemented as a normal control signal in the ACM38U-Y (CCID). The electrical specifications of this contact are identical to those of the signal RST (at contact C2).

4.3. Card Type Selection

The controlling computer must always select the card type through the proper command sent to the ACM38U-Y (CCID) prior to activating the inserted card. This includes both the memory cards and MCU-based cards.

For MCU-based cards, the reader allows to select the preferred protocol, T=0 or T=1. However, this selection is only accepted and carried out by the reader through the PPS when the card inserted in the reader supports both protocol types. Whenever a MCU-based card supports only one protocol type, T=0 or T=1, the reader automatically uses that protocol type, regardless of the protocol type selected by the application.

4.4. Interface for Microcontroller-based Cards

For microcontroller-based smart cards, only the contacts C1 (VCC), C2 (RST), C3 (CLK), C5 (GND) and C7 (I/O) are used. A frequency of 4 MHz is applied to the CLK signal (C3).

4.5. Card Tearing Protection

The ACM38U-Y (CCID) provides a mechanism to protect the inserted card when it is suddenly withdrawn while it is powered up. The power supply to the card and the signal lines between the ACM38U-Y (CCID) and the card is immediately deactivated when the card is being removed. However, as a rule to avoid any electrical damage, a card should only be removed from the reader while it is powered down.

Note: The ACM38U-Y (CCID) never switches on the power supply to the inserted card by itself. The controlling computer through the proper command sent to the reader must explicitly do this.

5.0. Power Supply

The ACM38U-Y (CCID) requires a voltage of 5 V DC, 100 mA, regulated, power supply. The ACM38U-Y (CCID) gets its power supply from the computer (through the cable supplied along with each type of reader).

5.1. LED

5.1.1. Status

The LED indicates the activation status of the smart card interface:

• Flashing slowly (turns on 200 ms every 2 seconds)

Indicates ACM38U-Y (CCID) is powered up and in the standby state. Either the smart card has not been inserted or the smart card has not been powered up (if it is inserted).

Lighting up

Indicates power supply to the smart card is switched on (i.e., the smart card is activated).

Flashing quickly

Indicates there are communications between ACM38U-Y (CCID) and smart card.

5.1.2. Configuration

5.1.2.1. **USB Power LED**

ACM38U-Y uses a jumper to allow the user to switch on the USB power LED.

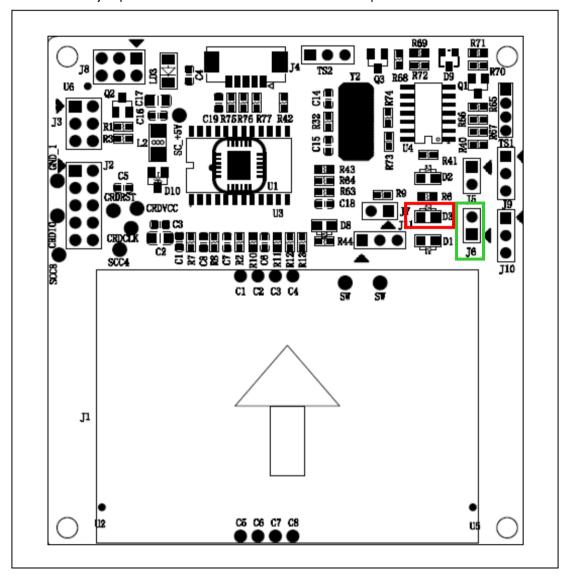

Figure 1: USB Power LED Configuration

The user must set the jumper (J6) to enable the USB power indicator LED (D3).

When there is a USB power connected to the module, the LED will be red in color.

5.1.2.2. Status LED

ACM38U-Y uses a jumper to allow the user to switch on the status LED.

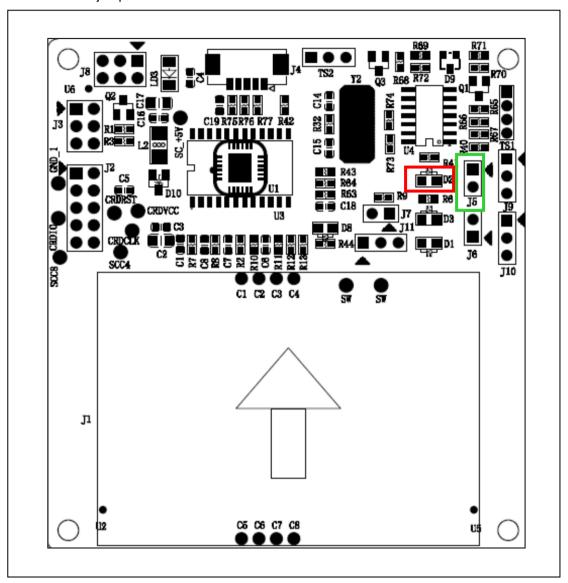

Figure 2: Status LED Configuration

The user must set the jumper (J5) in order to enable the Status LED (D2).

Please refer to **Section 5.1.1** for the status indicators.

6.0. Hardware Connections

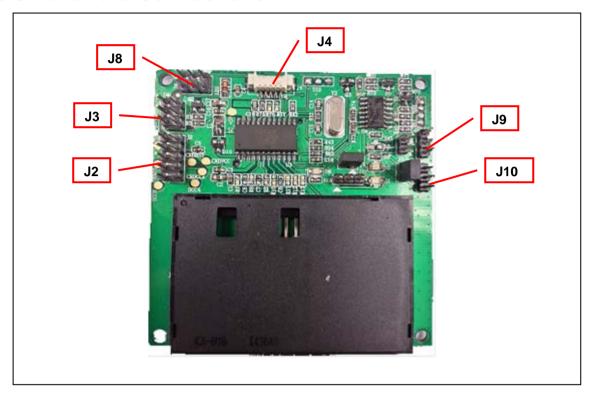

Figure 3: ACM38U-Y Hardware Connections

Jumper	Connector		
J2	External contact card connector

7.0. USB Interface

7.1. Communication Parameters

The ACM38U-Y (CCID) is connected to a computer through USB as specified in the USB Specification 2.0. The ACM38U-Y (CCID) is working in full speed mode (i.e. 12 Mbps).

Pin	Signal	Function
1	V_{BUS}	+5 V power supply for the reader
2	D-	Differential signal transmits data between ACM38U-Y (CCID) and computer
3	D+	Differential signal transmits data between ACM38U-Y (CCID) and computer
4	GND	Reference voltage level for power supply

Table 2: USB Interface Wiring

Note: In order for the ACM38U-Y (CCID) to function properly through USB interface, either ACS CCID driver or the Microsoft CCID driver has to be installed.

7.2. Endpoints

The ACM38U-Y (CCID) uses the following endpoints to communicate with the host computer:

,	,
Control Endpoint	For setup and control purpose
Bulk OUT	For command to be sent from host to ACM38U-Y (CCID) (data packet size is 64 bytes)
Bulk IN	For response to be sent from ACM38U-Y (CCID) to host (data packet size is 64 bytes)
Interrupt IN	For card status message to be sent from ACM38U-Y (CCID) to host (data packet size is 8 bytes)

8.0. Communication Protocol

ACM38U-Y (CCID) shall interface with the host through the USB connection. A specification, namely CCID, has been released within the industry defining such a protocol for the USB chip-card interface devices. CCID covers all the protocols required for operating smart cards.

The configurations and usage of USB endpoints on ACM38U-Y (CCID) shall follow CCID Rev 1.0 Section 3.

An overview is summarized below:

- 1. **Control Commands** are sent on control pipe (default pipe). These include class-specific requests and USB standard requests. Commands that are sent on the default pipe report information back to the host on the default pipe.
- 2. **CCID Events** are sent on the interrupt pipe.
- 3. **CCID Commands** are sent on BULK-OUT endpoint. Each command sent to ACM38U-Y (CCID) has an associated ending response. Some commands can also have intermediate responses.
- 4. **CCID Responses** are sent on BULK-IN endpoint. All commands sent to ACM38U-Y (CCID) have to be sent synchronously [e.g., *bMaxCCIDBusySlots* is equal to 01h for ACM38U-Y (CCID)].

The ACM38U-Y (CCID) supported CCID features are indicated in its Class Descriptor:

Offset	Field	Size	Value	Description
0	bLength	1		Size of this descriptor, in bytes.
1	bDescriptorType	1		CCID Functional Descriptor type.
2	bcdCCID	2		CCID Specification Release Number in Binary-coded decimal.
4	bMaxSlotIndex	1		One slot is available on ACM38U-Y (CCID).
5	bVoltageSupport	1		ACM38U-Y (CCID) can supply 1.8 V, 3 V, and 5 V to its slot.
6	dwProtocols	4		ACM38U-Y (CCID) supports T=0 and T=1 protocol.
10	dwDefaultClock	4		Default ICC clock frequency is 4 MHz.
14	dwMaximumClock	4		Maximum supported ICC clock frequency is 4 MHz.
18	bNumClockSupported	1		Does not support manual setting of clock frequency.
19	dwDataRate	4		Default ICC I/O data rate is 10752 bps.
23	dwMaxDataRate	4		Maximum supported ICC I/O data rate is 344 Kbps.
27	bNumDataRatesSupported	1		Does not support manual setting of data rates.
28	dwMaxIFSD	4		Maximum IFSD supported by ACM38U-Y (CCID) for protocol T=1 is 254.
32	dwSynchProtocols	4	_	ACM38U-Y (CCID) does not support synchronous card.
36	dwMechanical	4		ACM38U-Y (CCID) does not support special mechanical characteristics.

Offset	Field	Size	Value	Description
40	dwFeatures	4		ACM38U-Y (CCID) supports the following features: Automatic ICC clock frequency change according to parameters Automatic baud rate change according to frequency and FI,DI parameters TPDU level change with ACM38U-Y (CCID)
44	dwMaxCCIDMessageLength	4		Maximum message length accepted by ACM38U-Y (CCID) is 271 bytes.
48	bClassGetResponse	1		Insignificant for TPDU level exchanges.
49	bClassEnvelope	1		Insignificant for TPDU level exchanges.
50	wLCDLayout	2		No LCD.
52	bPINSupport	1		With PIN Verification.
53	bMaxCCIDBusySlots	1		Only 1 slot can be simultaneously busy.

9.0. Memory Card Type Selection

SELECT_CARD_TYPE command must be executed first before other memory card commands. This command powers up and down the selected card inserted in the card reader and performs a card reset. This command can only be used after the logical smart card reader communication has been established using the *SCardConnect()* API.

Note: For details of SCardConnect() API, please refer to PC/SC specifications. For the Memory Card Command Set, please refer to **Section 10.3** of this reference manual.

A code snippet of the program flow is given below to demonstrate how to select the memory card type in ACM38U-Y (CCID):

```
SCARDCONTEXT hContext;
SCARDHANDLE hCard;
unsigned long dwActProtocol;
SCARD_IO_REQUEST ioRequest;
DWORD size = 64, SendLen = 6, RecvLen = 255, retCode;
byte cardType;
//Establish PC/SC Connection
retCode = SCardEstablishContext (SCARD SCOPE USER, NULL,
                                                                  NULTIT.
&hContext);
//List all readers in the system
retCode = SCardListReaders (hContext, NULL, readerName, &size);
//Connect to the reader
retCode = SCardConnect(hContext,
                                     readerName, SCARD_SHARE_SHARED,
SCARD_PROTOCOL_T0, &hCard, &dwActProtocol);
//Select Card Type
unsigned char SendBuff[] = {FF,A4,00,00,01,cardType};
retCode = SCardTransmit( hCard, &ioRequest, SendBuff, SendLen, NULL,
RecvBuff, &RecvLen);
//Disconnect from the reader
retCode = SCardDisconnect(hCard, SCARD_UNPOWER_CARD);
//End the established context
retCode = SCardReleaseContext(hContext);
```

10.0.Commands

10.1. CCID Command Pipe Bulk-OUT Messages

ACM38U-Y (CCID) shall follow the CCID Bulk-OUT Messages as specified in CCID Rev 1.0 Section 4.1. In addition, this specification defines some extended commands for operating additional features.

This section lists the CCID Bulk-OUT Messages to be supported by ACM38U-Y (CCID).

10.1.1. PC_to_RDR_IccPowerOn

This command activates the card slot and returns ATR data from the card.

Offset	Field	Size	Value	Description
0	bMessageType	1	62h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
2	bSlot	1		Identifies the slot number for this command.
5	bSeq	1		Sequence number for command.
6	bPowerSelect	1		Voltage that is applied to the ICC: 00h = Automatic Voltage Selection 01h = 5 V 02h = 3 V
7	abRFU	2		Reserved for future use.

The response to this command message is the *RDR_to_PC_DataBlock* response message and the data returned is the Answer-To-Reset (ATR) data.

10.1.2. PC to RDR IccPowerOff

This command deactivates the card slot.

Offset	Field	Size	Value	Description
0	bMessageType	1	63h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	abRFU	3		Reserved for future use.

The response to this message is the RDR_to_PC_SlotStatus message.

10.1.3. PC_to_RDR_GetSlotStatus

This command gets the current status of the slot.

Offset	Field	Size	Value	Description
0	bMessageType	1	65h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	abRFU	3		Reserved for future use.

The response to this message is the RDR_to_PC_SlotStatus message.

10.1.4. PC_to_RDR_XfrBlock

This command transfers data block to the ICC.

Offset	Field	Size	Value	Description
0	bMessageType	1	6Fh	
1	dwLength	4		Size of abData field of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	bBWI	1		Used to extend the CCIDs Block Waiting Timeout for this current transfer. The CCID will timeout the block after "this number multiplied by the Block Waiting Time" has expired.
8	wLevelParameter	2	0000h	RFU (TPDU exchange level).
10	abData	Byte array		Data block sent to the CCID. Data is sent "as is" to the ICC (TPDU exchange level).

The response to this message is the RDR_to_PC_DataBlock message.

10.1.5. PC_to_RDR_GetParameters

This command gets the slot parameters.

Offset	Field	Size	Value	Description
0	bMessageType	1	6Ch	
1	DwLength	4	00000000h	Size of extra bytes of this message.
5	BSlot	1		Identifies the slot number for this command.
6	BSeq	1		Sequence number for command.
7	AbRFU	3		Reserved for future use.

The response to this message is the *RDR_to_PC_Parameters* message.

10.1.6. PC_to_RDR_ResetParameters

This command resets slot parameters to the default value.

Offset	Field	Size	Value	Description
0	bMessageType	1	6Dh	
1	DwLength	4	00000000h	Size of extra bytes of this message.
5	BSlot	1		Identifies the slot number for this command.
6	BSeq	1		Sequence number for command.
7	AbRFU	3		Reserved for future use.

The response to this message is the *RDR_to_PC_Parameters* message.

10.1.7. PC_to_RDR_SetParameters

This command sets the slot parameters.

Offset	Field	Size	Value	Description
0	bMessageType	1	61h	
1	dwLength	4		Size of extra bytes of this message.
5	bSlot	1		Identifies the slot number for this command.
6	bSeq	1		Sequence number for command.
7	bProtocolNum	1		Specifies what protocol data structure follows. 00h = Structure for protocol T=0 01h = Structure for protocol T=1 The following values are reserved for future use: 80h = Structure for 2-wire protocol 81h = Structure for 3-wire protocol 82h = Structure for I2C protocol
8	abRFU	2		Reserved for future use.
10	abProtocolDataStructure	Byte array		Protocol Data Structure.

Protocol Data Structure for Protocol T=0 (dwLength=00000005h)

Offset	Field	Size	Value	Description
10	bmFindexDindex	1		B7-4 - FI - Index into the table 7 in ISO/IEC 7816-3:1997 selecting a clock rate conversion factor B3-0 - DI - Index into the table 8 in ISO/IEC 7816-3:1997 selecting a baud rate conversion factor

Offset	Field	Size	Value	Description
11	bmTCCKST0	1		B0 – 0b, B7-2 – 000000b B1 – Convention used (b1=0 for direct, b1=1 for inverse) Note: The CCID ignores this bit.
12	bGuardTimeT0	1		Extra Guardtime between two characters. Add 0 to 254 etu to the normal guardtime of 12 etu. FFh is the same as 00h.
13	bWaitingIntegerT0	1		WI for T=0 used to define WWT
14	bClockStop	1		ICC Clock Stop Support 00h = Stopping the Clock is not allowed 01h = Stop with Clock signal Low 02h = Stop with Clock signal High 03h = Stop with Clock either High or Low

Protocol Data Structure for Protocol T=1 (dwLength=00000007h)

Offset	Field	Size	Value	Description
10 bmFindexDin	has Finales Directors	1		B7-4 - FI - Index into the table 7 in ISO/IEC 7816-3:1997 selecting a clock rate conversion factor
				B3-0 - DI - Index into the table 8 in ISO/IEC 7816-3:1997 selecting a baud rate conversion factor
				B7-2 – 000100b
11	BmTCCKST1	1		B0 - Checksum type (b0=0 for LRC, b0=1 for CRC)
11				B1 - Convention used (b1=0 for direct, b1=1 for inverse)
				Note: The CCID ignores this bit.
12	BGuardTimeT1	1		Extra Guardtime (0 to 254 etu between two characters). If value is FFh, then guardtime is reduced by 1 etu.
13	BwaitingIntegerT1	1		B7-4 = BWI values 0-9 valid
				B3-0 = CWI values 0-Fh valid

Offset	Field	Size	Value	Description
14	bClockStop	1		ICC Clock Stop Support 00h = Stopping the Clock is not allowed 01h = Stop with Clock signal Low 02h = Stop with Clock signal High 03h = Stop with Clock either High or Low
15	bIFSC	1		Size of negotiated IFSC
16	bNadValue	1	00h	Only support NAD = 00h

The response to this message is the *RDR_to_PC_Parameters* message.

10.2. CCID Bulk-IN Messages

The Bulk-IN messages are used in response to the Bulk-OUT messages. ACM38U-Y (CCID) shall follow the CCID Bulk-IN Messages as specified in CCID Rev 1.0 Section 4.2.

This section lists the CCID Bulk-IN Messages to be supported by ACM38U-Y (CCID).

10.2.1. RDR_to_PC_DataBlock

This command is sent by ACM38U-Y (CCID) in response to *PC_to_RDR_IccPowerOn*, *PC_to_RDR_XfrBlock* and *PC_to_RDR_Secure* messages.

Offset	Field	Size	Value	Description
0	bMessageType	1	80h	Indicates that a data block is being sent from the CCID.
1	dwLength	4		Size of extra bytes of this message.
5	bSlot	1		Same value as in Bulk-OUT message.
6	bSeq	1		Same value as in Bulk-OUT message.
7	bStatus	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
8	bError	1		Slot error register as defined in CCID Rev 1.0 Section 4.2.1.
9	bChainParameter	1	00h	RFU (TPDU exchange level).
10	abData	Byte array		This field contains the data returned by the CCID.

10.2.2. RDR_to_PC_SlotStatus

This command is sent by ACM38U-Y (CCID) in response to *PC_to_RDR_lccPowerOff*, *PC_to_RDR_GetSlotStatus*, *PC_to_RDR_Abort* messages and Class Specific ABORT request.

Offset	Field	Size	Value	Description
0	bMessageType	1	81h	
1	dwLength	4	00000000h	Size of extra bytes of this message.
5	bSlot	1		Same value as in Bulk-OUT message.
6	bSeq	1		Same value as in Bulk-OUT message.
7	bStatus	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
8	bError	1		Slot error register as defined in CCID Rev 1.0 Section 4.2.1.

Offset	Field	Size	Value	Description
9	bClockStatus	1		Value: 00h = Clock running 01h = Clock stopped in state L 02h = Clock stopped in state H 03h = Clock stopped in an unknown state All other values are RFU.

10.2.3. RDR_to_PC_Parameters

This message is sent by ACM38U-Y (CCID) in response to *PC_to_RDR_GetParameters*, *PC_to_RDR_ResetParameters* and *PC_to_RDR_SetParameters* messages.

Offset	Field	Size	Value	Description
0	bMessageType	1	82h	
1	dwLength	4		Size of extra bytes of this message.
5	bSlot	1		Same value as in Bulk-OUT message.
6	bSeq	1		Same value as in Bulk-OUT message.
7	bStatus	1		Slot status register as defined in CCID Rev 1.0 Section 4.2.1.
8	bError	1		Slot error register as defined in CCID Rev 1.0 Section 4.2.1.
				Specifies what protocol data structure follows.
				00h = Structure for protocol T=0
				01h = Structure for protocol T=1
9	bProtocolNum	1		The following values are reserved for future use:
				80h = Structure for 2-wire protocol
				81h = Structure for 3-wire protocol
				82h = Structure for I2C protocol
10	abProtocolDataStructure	Byte array		Protocol Data Structure.

10.3. Memory Card Command Set

This section contains the Memory Card Command Set for ACM38U-Y (CCID).

10.3.1. Memory Card – 1, 2, 4, 8 and 16 kilobit I2C Card

10.3.1.1. SELECT CARD TYPE

This command powers up and down the selected card that is inserted in the card reader and performs a card reset.

Note: This command can only be used after the logical smart card reader communication has been established using the SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (abData field in the PC to RDR XfrBlock)

Pseudo-APDU					
CLA	A INS P1 P2 Lc Card Type				
FFh	A4h	00h	00h	01h	01h

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error

10.3.1.2. SELECT_PAGE_SIZE

This command selects the page size to read the smart card. The default value is 8-byte page write. It resets to default value whenever the card is removed or the reader is powered off.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU						
CLA	INS	P1	P2	Lc	Page Size	
FFh	01h	00h	00h	01h		

Where:

Page size = 03h for 8-byte page write

= 04h for 16-byte page write

= 05h for 32-byte page write

= 06h for 64-byte page write

= 07h for 128-byte page write

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.1.3. READ_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU					
CLA	INIC	Byte A	ddress	NATE NA L	
CLA	INS	MSB	LSB	MEM_L	
FFh	B0h				

Where:

Byte Address Memory address location of the memory card

MEM_L Length of data to be read from the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 	BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card

SW1 SW2 = 90 00h if no error

10.3.1.4. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU							
CLA	INIC	Byte A	ddress	MEM	Duto 4			Durto n
CLA	INS	MSB	LSB	MEM_L	Byte 1			Byte n
FFh	D0h							

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.2. Memory Card – 32, 64, 128, 256, 512, and 1024 kilobit I2C Card

10.3.2.1. SELECT_CARD_TYPE

This command powers up and down the selected card that is inserted in the card reader and performs a card reset.

Note: This command can only be used after the logical smart card reader communication has been established using the SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU					
CLA	CLA INS P1 P2 Lc Card Type				
FFh	A4h	00h	00h	01h	02h

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.2.2. SELECT_PAGE_SIZE

This command selects the page size to read the smart card. The default value is 8-byte page write. It resets to default value whenever the card is removed or the reader is powered off.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU						
CLA	INS	P1	P2	Lc	Page size	
FFh	01h	00h	00h	01h		

Where:

Data TPDU to be sent to the card

Page size = 03h for 8-byte page write

= 04h for 16-byte page write= 05h for 32-byte page write= 06h for 64-byte page write

= 07h for 128-byte page write

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.2.3. READ_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU				
OL 4	INIC	Byte A	ddress	NAITNA I
CLA	INS	MSB	LSB	MEM_L
FFh				

Where:

INS = B0h for 32, 64, 128, 256, 512 kilobit iic card

= 1011 000*b for 1024 kilobit iic card,

where * is the MSB of the 17 bit addressing

Byte Address Memory address location of the memory card

MEM_L Length of data to be read from the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 :	BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card

10.3.2.4. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU							
CLA	INIC	Byte Address		NATE NA L	D. 1			Durto n
CLA	INS	MSB	LSB	MEM_L	Byte 1			Byte n
FFh								

Where:

INS = D0h for 32, 64, 128, 256, 512 kilobit iic card

= 1101 000*b for 1024 kilobit iic card,

where * is the MSB of the 17 bit addressing

Byte Address Memory address location of the memory card

MEM_L Length of data to be written to the memory card

Byte x Data to be written to the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.3. Memory Card – Atmel AT88SC153

10.3.3.1. SELECT_CARD_TYPE

This command powers up and down the selected card that is inserted in the card reader and performs a card reset. It will also select the page size to be 8-byte page write.

Note: This command can only be used after the logical smart card reader communication has been established using the SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU					
CLA	INS P1 P2 Lc Card Type				Card Type
FFh	A4h	00h	00h	01h	03h

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.3.2. READ_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU						
CLA	INS	P1	Byte Address	MEM_L		
FFh		00h				

Where:

INS = B0h for reading zone 00b

= B1h for reading zone 01b= B2h for reading zone 10b= B3h for reading zone 11b

= B4h for reading fuse

Byte Address Memory address location of the memory card

MEM_L Length of data to be read from the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 	BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card

10.3.3.3. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INS	P1	Byte Address	MEM_L	Byte 1			Byte n
FFh		00h						

Where:

INS = D0h for writing zone 00b

= D1h for writing zone 01b= D2h for writing zone 10b= D3h for writing zone 11b

= D4h for writing fuse

Byte Address Memory address location of the memory card

MEM_L Length of data to be written to the memory card

MEM_D Data to be written to the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.3.4. VERIFY_PASSWORD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU							
CLA	INS	P1	P2	Lc	Pw(0)	Pw(1)	Pw(2)
FFh	20h	00h		03h			

Where:

Pw(0),Pw(1),Pw(2) Passwords to be sent to memory card

P2 = $0000 \ 00 \text{rp}_{b}$

where the two bits "rp" indicate the password to compare

r = 0: Write password,r = 1: Read password,

 $p: Password\ set\ number,$

rp = 01 for the secure code.

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2 ErrorCnt
90h	

Where:

SW1 = 90h

SW2 (ErrorCnt) = Error Counter. FFh indicates the verification is correct. 00h indicates

the password is locked (or exceeded the maximum number of retries).

Other values indicate the current verification has failed.

10.3.3.5. INITIALIZE_AUTHENTICATION

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU							
CLA	INS	P1	P2	Lc	Q(0)	Q(1)	 Q(7)
FFh	84h	00h	00h	08h			

Where:

Q(0),Q(1)...Q(7) Host random number, 8 bytes

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.3.6. VERIFY_AUTHENTICATION

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INS	P1	P2	Lc	Ch(0)	Ch(1)		Ch(7)
FFh	82h	00h	00h	08h				

Where:

Ch(0),Ch(1)...Ch(7)

Host challenge, 8 bytes

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.4. Memory Card – Atmel AT88C1608

10.3.4.1. SELECT_CARD_TYPE

This command powers up and down the selected card that is inserted in the card reader and performs a card reset. It will also select the page size to be 16-byte page write.

Note: This command can only be used after the logical smart card reader communication has been established using the SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU					
CLA	INS	P1	P2	Lc	Card Type
FFh	A4h	00h	00h	01h	04h

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.4.2. READ_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU							
CLA	INS	Zone Address	Byte Address	MEM_L			
FFh							

Where:

INS = B0h for reading user zone

= B1h for reading configuration zone or reading fuse

Zone Address = $0000 \text{ } 0A_{10}A_9A_8b$ where A_{10} is the MSB of zone address

= don't care for reading fuse

Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

= 1000 0000b for reading fuse

MEM_L Length of data to be read from the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 	BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card

10.3.4.3. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU									
CLA	INS	Zone Address	Byte Address	MEM_L	Byte 1			Byte n	
FFh									

Where:

INS = D0h for writing user zone

= D1h for writing configuration zone or writing fuse

Zone Address = $0000 \ 0A_{10}A_9A_8b$ where A_{10} is the MSB of zone address

= Don't care for writing fuse

Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

= 1000 0000b for writing fuse

MEM_L Length of data to be written to the memory card

Byte x Data to be written to the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.4.4. VERIFY_PASSWORD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INS	P1	P2	Lc	Data			
FFh	20h	00h	00h	04h	RP	Pw(0)	Pw(1)	Pw(2)

Where:

Pw(0),Pw(1),Pw(2) Passwords to be sent to memory card

RP = $0000 \text{ rp}_2 \text{p}_1 \text{p}_0 \text{b}$

where the four bits " $rp_2p_1p_0$ " indicate the password to compare:

r = 0: Write password,r = 1: Read password,

p₂p₁p₀: Password set number.

 $(rp_2p_1p_0 = 0111 \text{ for the secure code})$

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2 ErrorCnt
90h	

Where:

SW1 = 90h

SW2 (ErrorCnt) = Error Counter. FFh indicates the verification is correct. 00h indicates

the password is locked (or exceeded the maximum number of retries).

Other values indicate the current verification has failed.

10.3.4.5. INITIALIZE_AUTHENTICATION

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INS	P1	P2	Lc	Q(0)	Q(1)		Q(7)
FFh	84h	00h	00h	08h				

Where:

Byte Address Memory address location of the memory card

Q(0),Q(1)...Q(7) Host random number, 8 bytes

Response Data Format (abData field in the RDR_to_PC_DataBlock)

Where:

10.3.4.6. VERIFY_AUTHENTICATION

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INS	P1	P2	Lc	Q1(0)	Q1(1)		Q1(7)
FFh	82h	00h	00h	08h				

Where:

Byte Address Memory address location of the memory card

Q1(0),Q1(1)...Q1(7) Host challenge, 8 bytes

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.5. Memory Card – SLE 4418/SLE 4428/SLE 5518/SLE 5528

10.3.5.1. SELECT_CARD_TYPE

This command powers up and down the selected card that is inserted in the card reader and performs a card reset.

Note: This command can only be used after the logical smart card reader communication has been established using the SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU						
CLA	INS	P1	P2	Lc	Card Type	
FFh	A4h	00h	00h	01h	05h	

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2			

Where:

10.3.5.2. READ_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU						
	INS	Byte A	ddress	NATE NA L		
CLA		MSB	LSB	MEM_L		
FFh	B0h					

Where:

MSB Byte Address = $0000 \ 00A_9A_8b$ is the memory address location of the memory card

LSB Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

MEM_L Length of data to be read from the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1	 	BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card

10.3.5.3. READ_PRESENTATION_ERROR_COUNTER_MEMORY_CARD (SLE 4428 and SLE 5528)

This command is used to read the presentation error counter for the secret code.

Command Format (abData field in the PC to RDR XfrBlock)

Pseudo-APDU							
CLA	INS	P1	P2	MEM_L			
FFh	B1h	00h	00h	03h			

Response Data Format (abData field in the RDR_to_PC_DataBlock)

ERRCNT	DUMMY 1	DUMMY 2	SW1	SW2

Where:

ERRCNT Error Counter. FFh indicates that the last verification is correct. 00h indicates

that the password is locked (exceeded the maximum number of retries).

Other values indicate that the last verification has failed.

DUMMY Two bytes dummy data read from the card

10.3.5.4. READ_PROTECTION_BIT

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU							
CLA	INIC	Byte A	MENA					
CLA	INS	MSB	LSB	MEM_L				
FFh	B2h							

Where:

MSB Byte Address = $0000 \ 00A_9A_8b$ is the memory address location of the memory card

LSB Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

MEM_L Length of protection bits to be read from the card, in multiples of 8

bits. Maximum value is 32.

 $MEM_L = 1 + INT((number of bits - 1)/8)$

Example: To read 8 protection bits starting from memory 0010h, the following pseudo-APDU should be issued:

FFh B2h 00h 10h 01h

Response Data Format (abData field in the RDR_to_PC_DataBlock)

PROT 1	 	PROT L	SW1	SW2

Where:

PROT y Bytes containing the protection bits

SW1, SW2 = 90 00h if no error

The arrangement of the protection bits in the PROT bytes is as follows:

	PROT 1						PROT 2													
P8	P7	P6	P5	P4	P3	P2	P1	P16	P15	P14	P13	P12	P11	P10	P9	 	 		P18	P17

Where:

Px is the protection bit of BYTE x in the response data

'0' byte is write protected

'1' byte can be written

10.3.5.5. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CI 4	INIC	Byte Address		NATE NA L	Duta 4			Durin N
CLA	INS	MSB	LSB	MEM_L	Byte 1			Byte N
FFh	D0h							

Where:

MSB Byte Address = $0000 \ 00A_9A_8b$ is the memory address location of the memory card

LSB Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

MEM_L Length of data to be written to the memory card

Byte x Data to be written to the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.5.6. WRITE_PROTECTION_MEMORY_CARD

Each byte specified in the command is used in the card to compare the byte stored in a specified address location. If the data match, the corresponding protection bit is irreversibly programmed to '0'.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INIC	Byte Address		NAENA I	Duto 4			Durto M
CLA	INS	MSB	LSB	MEM_L	Byte 1			Byte N
FFh	D1h							

Where:

MSB Byte Address = $0000 \ 00A_9A_8b$ is the memory address location of the memory card

LSB Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

MEM_L Length of data to be written to the memory card

Byte x Byte values to be compared with the data in the card starting at Byte

Address. BYTE 1 is compared with the data at Byte Address; BYTE

N is compared with the data at (Byte Address+N-1).

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error

10.3.5.7. PRESENT_CODE_MEMORY_CARD (SLE 4428 and SLE 5528)

This command is used to submit the secret code to the memory card to enable the write operation with the SLE 4428 and SLE 5528 card, the following actions are executed:

- 1. Search a '1' bit in the presentation error counter and write the bit to '0'.
- 2. Present the specified code to the card.
- 3. Try to erase the presentation error counter.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	INIC	D4	Do	NAENA I	CO	DE		
CLA	INS	PT	P2	MEM_L	Byte 1	Byte 2		
FFh	20h	00h	00h	02h				

Where:

CODE Two bytes secret code (PIN)

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2 ErrorCnt
90h	

Where:

SW1 = 90h

SW2 (ErrorCnt)

= Error Counter. FFh indicates successful verification. 00h indicates that the password is locked (or exceeded the maximum number of retries). Other values indicate that current verification has failed.

10.3.6. Memory Card – SLE 4432/SLE 4442/SLE 5532/SLE 5542

10.3.6.1. SELECT_CARD_TYPE

This command powers down and up the selected card that is inserted in the card reader and performs a card reset.

Note: This command can only be used after the logical smart card reader communication has been established using the SCardConnect() API. For details of SCardConnect() API, please refer to PC/SC specifications.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU											
CLA	INS	P1	P2	Lc	Card Type						
FFh	A4h	00h	00h	01h	06h						

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.6.2. READ_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU										
CLA	INS	P1	Byte Address	MEM_L							
FFh	B0h	00h									

Where:

Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

MEM_L Length of data to be read from the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

BYTE 1			BYTE N	SW1	SW2	

Where:

BYTE x Data read from memory card

10.3.6.3. READ_PRESENTATION_ERROR_COUNTER_MEMORY_CARD (SLE 4442 and SLE 5542)

This command is used to read the presentation error counter for the secret code.

Command Format (abData field in the PC to RDR XfrBlock)

Pseudo-APDU										
CLA	INS	P1	P2	MEM_L						
FFh	B1h	00h	00h	04h						

Response Data Format (abData field in the RDR_to_PC_DataBlock)

ERRCNT	DUMMY 1	DUMMY 2	DUMMY 3	SW1	SW2

Where:

ERRCNT Error counter. 07h indicates that the last verification is correct. 00h indicates

that the password is locked (exceeded the maximum number of retries).

Other values indicate that the last verification has failed.

DUMMY Three bytes dummy data read from the card

10.3.6.4. READ_PROTECTION_BITS

This command is used to read the protection bits for the first 32 bytes.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU										
CLA	INS	P1	P2	MEM_L						
FFh	B2h	00h	00h	04h						

Response Data Format (abData field in the RDR_to_PC_DataBlock)

PROT 1	PROT 2	PROT 3	PROT 4	SW1	SW2

Where:

PROT y Bytes containing the protection bits from protection memory

SW1, SW2 = 90 00h if no error

The arrangement of the protection bits in the PROT bytes is as follows:

	PROT 1				PROT 2																		
P8	P7	P6	P5	P4	P3	P2	P1	P16	P15	P14	P13	P12	P11	P10	P9							P18	P17

Where:

Px is the protection bit of BYTE x in the response data

'0' byte is write protected

'1' byte can be written

10.3.6.5. WRITE_MEMORY_CARD

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU												
CLA	CLA INS P1 Byte Address MEM_L Byte 1 Byte												
FFh	D0h	00h											

Where:

Byte Address = $A_7A_6A_5A_4$ $A_3A_2A_1A_0b$ is the memory address location of the memory

card

MEM_L Length of data to be written to the memory card

Byte x Data to be written to the memory card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

SW1 SW2 = 90 00h if no error

10.3.6.6. WRITE_PROTECTION_MEMORY_CARD

Each byte specified in the command is internally in the card compared with the byte stored at the specified address and if the data match, the corresponding protection bit is irreversibly programmed to '0'

Command Format (abData field in the PC_to_RDR_XfrBlock)

	Pseudo-APDU													
CLA	CLA INS P1 Byte Address MEM_L Byte 1 Byte													
FFh	D1h	00h												

Where:

Byte Address = $000A_4$ $A_3A_2A_1A_0b$ (00h to 1Fh) is the protection memory address

location of the memory card

MEM_L Length of data to be written to the memory card

Byte x Byte values to be compared with the data in the card starting at Byte

Address. BYTE 1 is compared with the data at Byte Address; BYTE N is

compared with the data at (Byte Address+N-1).

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.6.7. PRESENT_CODE_MEMORY_CARD (SLE 4442 and SLE 5542)

To submit the secret code to the memory card to enable the write operation with the SLE 4442 and SLE 5542 card, the following actions are executed:

- 1. Search a '1' bit in the presentation error counter and write the bit to '0'.
- 2. Present the specified code to the card.
- 3. Try to erase the presentation error counter.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA	CODE							
CLA	INS	P1	P2	MEM_L	Byte 1	Byte 2	Byte 3	
FFh	20h	00h	00h	03h				

Where:

CODE Three bytes secret code (PIN)

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2 ErrorCnt
90h	

Where:

SW1 = 90h

SW2 (ErrorCnt)

= Error Counter. 07h indicates that the verification is correct. 00h indicates the password is locked (exceeded the maximum number of retries). Other values indicate that the current verification has failed.

10.3.6.8. CHANGE_CODE_MEMORY_CARD (SLE 4442 and SLE 5542)

This command is used to write the specified data as new secret code in the card.

The current secret code must have been presented to the card with the *PRESENT_CODE* command prior to the execution of this command.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA INS P1 P2 MEM L								
CLA	INS	FI	F2	MEM_L	Byte 1	Byte 2	Byte 3

BYTE 1	 :	BYTE N	SW1	SW2

Where:

BYTE x Data read from memory card

10.3.7.3. WRITE ONE BYTE MEMORY CARD

This command is used to write one byte to the specified address of the inserted card. The byte is written to the card with LSB first (i.e., the bit at card address 0 is regarded as the LSB of byte 0).

Four different WRITE modes are available for this card type, which are distinguished by a flag in the command data field:

a. Write

The byte value specified in the command is written to the specified address. This command can be used for writing personalization data and counter values to the card.

b. Write with carry

The byte value specified in the command is written to the specified address and the command is sent to the card to erase the next lower counter stage. Thus, this write mode can only be used for updating the counter value in the card.

c. Write with backup enabled (SLE 4436, SLE 5536 and SLE 6636 only)

The byte value specified in the command is written to the specified address. This command can be used for writing personalization data and counter values to the card. Backup bit is enabled to prevent data loss when card tearing occurs.

d. Write with carry and backup enabled (SLE 4436, SLE 5536 and SLE 6636 only)

The byte value specified in the command is written to the specified address and the command is sent to the card to erase the next lower counter stage. Thus, this write mode can only be used for updating the counter value in the card. Backup bit is enabled to prevent data loss when card tearing occurs.

With all write modes, the byte at the specified card address is not erased prior to the write operation and, hence, memory bits can only be programmed from '1' to '0'.

The backup mode available in the SLE 4436 and SLE 5536 card can be enabled or disabled in the write operation.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU								
CLA INS P1 Byte Address MEM_L MODE BYTE								
FFh	D0h	00h		02h

01h: Write with carry

02h: Write with backup enabled (SLE 4436, SLE 5536 and SLE 6636

only)

03h: Write with carry and with backup enabled (SLE 4436, SLE 5536 and

SLE 6636 only)

BYTE Byte value to be written to the card

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.7.4. PRESENT_CODE_MEMORY_CARD

To submit the secret code to the memory card to enable the card personalization mode, the following actions are executed:

- 1. Search a '1' bit in the presentation counter and write the bit to '0'.
- 2. Present the specified code to the card.

The ACM38U-Y (CCID) does not try to erase the presentation counter after the code submission. This must be done by the application software through a separate 'Write with carry' command.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU									
CLA	INS	P1	P2	MEMI		CO	DE

Response Data Format (abData field in the RDR_to_PC_DataBlock)

SW1	SW2

Where:

10.3.7.5. AUTHENTICATE_MEMORY_CARD (SLE 4436, SLE 5536 and SLE 6636)

To read a card authentication certificate from a SLE 5536 or SLE 6636 card, the ACM38U-Y (CCID) executes the following actions:

- 1. Select Key 1 or Key 2 in the card as specified in the command.
- 2. Present the challenge data specified in the command to the card.
- Generate the specified number of CLK pulses for each bit of authentication data computed by the card.
- 4. Read 16 bits of authentication data from the card.
- 5. Reset the card to normal operation mode.

The authentication has to be performed in two steps:

- 1. Send the Authentication Certificate to the card.
- 2. Get back two bytes of authentication data calculated by the card.

Step 1: Send Authentication Certificate to the Card.

Command Format (abData field in the PC_to_RDR_XfrBlock)

Pseudo-APDU											
CLA	INS	P1	P2	MEM				CODE			
CLA	IIVO	PI	F2	MEM_L	KEY	CLK_CNT	Byte 1	Byte 2		Byte 5	Byte 6

SW1 SW2 = 90 00h if no error

= 63 00h if there are no more retries

Note: After SW1SW2 = 9000h has been received, read back the User Error Counter to check if the VERIFY_USER_CODE is correct. If User Error Counter is erased and is equal to "FFh," the previous verification is successful.

10.3.8.6. VERIFY_MEMORY_CODE

This command is used to submit Memory Code (4 bytes) to the inserted card. Memory Code is used to authorize the reloading of the user memory, together with the User Code.

The following actions are executed:

- 1. Present the specified code to the card.
- 2. Search a '1' bit in the presentation error counter and write the bit to '0'.
- 3. Erase the presentation error counter. Please note that Memory Error Counter cannot be erased.

Where:

10.3.9.4. ERASE_NON_APPLICATION_ZONE

This command is used to erase the data in Non-Application Zones. The EEPROM memory is organized into 16-bit words. Although erases are performed on single bit, the ERASE operation clears an entire word in the memory. Therefore, performing an ERASE on any bit in the word will clear ALL 16 bits of that word to the state of '1'.

To erase Error Counter or the data in Application Zones, please refer to the following:

- 1. ERASE_APPLICATION_ZONE_WITH_ERASE command as specified in Section 10.3.9.5.
- 2. ERASE_APPLICATION_ZONE_WITH_WRITE_AND_ERASE command as specified in **Section 10.3.9.6**.
- 3. VERIFY_SECURITY_CODE commands as specified in Section 10.3.9.7.

in a response

C_TYPE The card types supported by the ACM38U-Y (CCID). This data field is a

bitmap with each bit representing a particular card type. A bit set to '1' means the corresponding card type is supported by the reader and can be selected with the SELECT CARD TYPE command. The bit assignment is as follows:

Byte 1 2
card type F E D C B A 9 8 7 6 5 4 3 2 1 0

Refer to the next section for the correspondence between these bits and the respective card types.

C_SEL The currently selected card type. A value of 00h means that no card type has

been selected.

C_STAT Indicates whether a card is physically inserted in the reader and whether the

card is powered up:

00h: No card inserted

01h: Card inserted, not powered up

03h: Card powered up

Appendix A. Supported Card Types

The following table summarizes the card type returned by *GET_READER_INFORMATION* correspond with the respective card type.

Byte	Card Type
00h	Auto-select T=0 or T=1 communication protocol
01h	I2C memory card (1, 2, 4, 8 and 16 kilobits)
02h	I2C memory card (32, 64, 128, 256, 512 and 1024 kilobits)
03h	Atmel AT88SC153 secure memory card
04h	Atmel AT88SC1608 secure memory card
05h	Infineon SLE 4418 and SLE 4428
06h	Infineon SLE 4432 and SLE 4442
07h	Infineon SLE 4406, SLE 4436 and SLE 5536
08h	Infineon SLE 4404
09h	Atmel AT88SC101, AT88SC102 and AT88SC1003
0Ch	MCU-based cards with T=0 communication protocol
0Dh	MCU-based cards with T=1 communication protocol

Table 3: Supported Card Types

Appendix B. Response Error Codes

The following table summarizes the possible error code returned by the ACM38U-Y (CCID):

Error Code	Status
FFh	SLOTERROR_CMD_ABORTED
FEh	SLOTERROR_ICC_MUTE
FDh	SLOTERROR_XFR_PARITY_ERROR
FCh	SLOTERROR_XFR_OVERRUN
FBh	SLOTERROR_HW_ERROR
F8h	SLOTERROR_BAD_ATR_TS
F7h	SLOTERROR_BAD_ATR_TCK
F6h	SLOTERROR_ICC_PROTOCOL_NOT_SUPPORTED
F5h	SLOTERROR_ICC_CLASS_NOT_SUPPORTED
F4h	SLOTERROR_PROCEDURE_BYTE_CONFLICE
F3h	SLOTERROR_DEACTIVATED_PROTOCOL
F2h	SLOTERROR_BUSY_WITH_AUTO_SEQUENCE
E0h	SLOTERROR_CMD_SLOT_BUSY

Table 4: Response Error Codes
